

Jens Laufer

FDE Lead — architecture, hands-on delivery and LLM agents in production, owned end to end with the client

Architecture & technical discovery · LLM agents, tool use & MCP · evaluation, quality gates & drift control · Python · Java / Spring Boot · Vue / TypeScript · REST & enterprise integration (SAP, ESB, canonical data models) · Docker / Kubernetes · CI/CD · observability · OAuth2 / OIDC

I own a technical engagement from the first conversation to the handover: discovery, target-state architecture, the trade-offs, and the code. Since 12/2025 I build and run LLM agent systems in production — an autonomous AI business partner that plans, writes code, tests and deploys around the clock, and Fabrik, a multi-agent platform where worker agents ship software in parallel. The hard part there is control, not prompting: quality gates an agent must pass before it may ship, approval gates before anything irreversible, observability over every run, and checks that catch an agent drifting from the spec. Before that, 29 years of back-end, full-stack and integration work inside client teams — Deutsche Telekom, Commerzbank, Volkswagen, 1&1, DVAG, Brunata. Freelance since 1997, so scoping, pushing back on what the evidence does not support, delivery and production support have always been one conversation.

FOCUS

End-to-end technical ownership: freelance since 1997, embedded in the client's team — technical discovery, architecture and design decisions, delivery, production support and handover, on site or remote.

AI-assisted engineering with controls, in production since 12/2025: agent loop with stop conditions, tool use over MCP, layered memory, RAG, quality gates and approval gates, observability over every run, budget and rate-limit control with model routing, and recovery after a killed run.

Verification against agent drift: agents' output is checked against the spec and the diff, not against their own report — a test must reproduce a bug red before the fix may turn it green.

Products shipped end to end as Solytics: Fabrik (multi-agent software delivery), a multi-tenant OIDC/OAuth2 identity and email platform, and a portfolio of browser extensions with live payments — architecture, build, deployment and operations in one hand.

Enterprise integration: invoice handover to **SAP** over an ESB (1&1), master data migration on a canonical XML model (Commerzbank), an industry file format in heating cost billing (Brunata).

Prototype to production: took over a running prototype at Deutsche Telekom and put it live — Docker/Kubernetes, tracing and CI included.

Autonomous AI agent systems — Harness & Agentic Engineering

Solytics GmbH · Remote — AI / SaaS

Harness engineering · Agent engineering · AI system architecture · Full-stack engineering · DevOps

Building and running autonomous LLM agent systems as a **harness engineer** — the engineering around the model, not the model itself. The harness is the product: the **agent loop** and its stop conditions, **tool use over MCP**, layered **memory** (durable facts, running context, session state), **approval gates** for anything irreversible, **quality gates** that must pass before an agent may ship, **observability** over every run, **budget and rate-limit control** with model routing and fallback, plus recovery when a run is killed mid-flight. A local multi-model proxy keeps the whole thing independent of any single provider. Two systems in production: a self-directing AI business partner that plans, writes code, tests and deploys around the clock, and **Fabrik** (fabrikhq.com), a multi-agent platform for autonomous software delivery with parallel worker agents. Event-driven orchestration over Telegram, GitHub and systemd; several AI-built SaaS products shipped end to end.

Digital property profile for owners

verkaufe.immobilien · Remote — Internet

Full-stack engineering · Solution design · DevOps

Full-stack development of a digital property profile that owners create and maintain themselves: Vue.js front-end, Python back-end (Eve) with a REST API and MongoDB. Built and maintained the GitLab CI pipelines for automated build and deployment. Worked to DevOps principles, owning build and operation of the services in Docker. Test-driven development, automated end-to-end tests with Playwright.

Front- and back-end, heating cost billing

Brunata · Remote — Industry

Full-stack engineering · Solution design · DevOps

Production server-side services and APIs in Java and Spring Boot: a microservice that parses and generates heating-cost files in the Haweiko-Arge industry format. Designed and built in a microservices architecture with REST interfaces (OpenAPI, Swagger), secured with Spring Security and Keycloak, persisted in MongoDB. Built and maintained the GitLab CI pipelines for automated build and deployment. Worked to DevOps principles, owning build and operation of the services in Docker. Test-driven development (JUnit, Mockito), automated end-to-end tests with Playwright. Front-end development.

Web-based configuration of telecommunications devices

Deutsche Telekom · Darmstadt/Remote — Telecommunications

DevOps · Build & configuration management · Full-stack engineering

Took over an existing prototype for configuring telecommunications devices over a web interface, developed it further and moved it into production. Production server-side services and APIs in Java and Spring Boot in a microservices architecture (REST, Feign, Spring Data/JPA), Vue.js front-end, secured with Keycloak, persisted in MySQL and MongoDB. Worked to DevOps principles, owning build, operation and monitoring of the services: Docker and Kubernetes (Rancher), logging and tracing via Kibana, Sleuth and Zipkin; built and maintained the GitLab CI pipelines.
