

Jens Laufer

FDE Lead — architecture, hands-on delivery and LLM agents in production, owned end to end with the client

Architecture & technical discovery · LLM agents, tool use & MCP · evaluation, quality gates & drift control · Python · Java / Spring Boot · Vue / TypeScript · REST & enterprise integration (SAP, ESB, canonical data models) · Docker / Kubernetes · CI/CD · observability · OAuth2 / OIDC

I own a technical engagement from the first conversation to the handover: discovery, target-state architecture, the trade-offs, and the code. Since 10/2025 I build and run LLM agent systems in production — an autonomous AI business partner that plans, writes code, tests and deploys around the clock, and Fabrik, a multi-agent platform where worker agents ship software in parallel. The hard part there is control, not prompting: quality gates an agent must pass before it may ship, approval gates before anything irreversible, observability over every run, and checks that catch an agent drifting from the spec. Before that, 29 years of back-end, full-stack and integration work inside client teams — Deutsche Telekom, Commerzbank, Volkswagen, 1&1, DVAG, Brunata. Freelance since 1997, so scoping, pushing back on what the evidence does not support, delivery and production support have always been one conversation.

FOCUS

End-to-end technical ownership: freelance since 1997, embedded in the client's team — technical discovery, architecture and design decisions, delivery, production support and handover, on site or remote.

AI-assisted engineering with controls, in production since 10/2025: agent loop with stop conditions, tool use over MCP, layered memory, RAG, quality gates and approval gates, observability over every run, budget and rate-limit control with model routing, and recovery after a killed run.

Verification against agent drift: agents' output is checked against the spec and the diff, not against their own report — a test must reproduce a bug red before the fix may turn it green.

Products shipped end to end as Solytics: Fabrik (multi-agent software delivery), a multi-tenant OIDC/OAuth2 identity and email platform, and a portfolio of browser extensions with live payments — architecture, build, deployment and operations in one hand.

Enterprise integration: invoice handover to **SAP** over an ESB (1&1), master data migration on a canonical XML model (Commerzbank), an industry file format in heating cost billing (Brunata).

Prototype to production: took over a running prototype at Deutsche Telekom and put it live — Docker/Kubernetes, tracing and CI included.

PROJECT HISTORY (SELECTION FROM 2009)

since 04/2026
ongoing

Fabrik — multi-agent platform for software delivery

Fabrik (fabrikhq.com) · Solytics GmbH · Remote — Software / AI
Architecture · Agent engineering · Full-stack engineering

Platform where worker agents turn tickets into pull requests in parallel (fabrikhq.com). A **control plane** (FastAPI, Vue) spawns one agent container per repository through the Docker socket. Each agent runs ticket sync (GitHub, GitLab, Jira), an actionability review, a plan, test-first implementation, a **quality gate** in a clean sidecar container, and the PR — it never merges on its own. Energy budget per agent, feedback from PR comments, one VPS per customer behind Caddy.

SQLite TDD

since 03/2026
ongoing

Launch Kit — multi-tenant identity and email platform

Launch Kit · Solytics GmbH · Remote — SaaS / IAM
Architecture · Back-end engineering · Security

OIDC-compliant auth server with email marketing as one Go binary and a Vue admin UI — a drop-in for Keycloak or Auth0. **OAuth2 with PKCE**, RS256 JWTs with a per-tenant RSA key, Login with Google, role-based access. Contacts, segments and campaigns with async sending, unsubscribe handling and GDPR consent. Strict tenant isolation; apps validate tokens over JWKS only and swap the provider by changing an environment variable. Runs the customer funnel of several own products.

Go OpenID Connect OAuth2 JWT Vue 3 SQLite Docker Caddy Playwright

E-invoicing and bookkeeping for a German GmbH

Solytics GmbH · Remote — Finance / Compliance
Back-end engineering · Domain design

API for **XRechnung 3.0** (UBL, CII) and **ZUGFeRD 2.3** with an extension framework for industry fields beyond EN 16931 (construction, healthcare, logistics). Five validation layers: Pydantic, BR-DE business rules, arithmetic consistency, XSD, Schematron; a GoBD-compliant invoice lifecycle. Alongside it, double-entry bookkeeping on SKR04 as a CLI: balance sheet, P&L, taxes, E-Bilanz and **DATEV export**, every statement checked against the journal. In real use for the own company.

Paid browser extensions — FinGrab, PlaylistGrab, InvoiceGrab

FinGrab · Solytics GmbH · Remote — FinTech / Browser software
Full-stack engineering · Release & operations

A portfolio of browser extensions for Chrome (MV3) and Firefox from one codebase with WXT and TypeScript; FinGrab exports market data from Yahoo Finance as CSV and has around 600 users. **Live payments** through ExtPay and Stripe, subscription and one-time purchase. End-to-end tests with Playwright against the built package, a regression diff against the shipped version, publishing over the API to the Chrome Web Store and addons.mozilla.org, monitoring of reviews, subscriptions and the payroll.

Autonomous AI business partner — Harness & agentic engineering

Solytics GmbH · Remote — AI / Automation

Harness engineering · Agent engineering · AI system architecture · DevOps

A self-directing agent built on Claude that plans, writes code, tests, deploys and reports around the clock. Built as a **harness engineer** — the engineering around the model: the **agent loop** and its stop conditions, **tool use over MCP**, layered **memory** (durable facts, running context, session state), **approval gates** for anything irreversible, **observability** over every run, **budget and rate-limit control** with model routing, plus recovery when a run is killed mid-flight. More than 40 purpose-built checks catch the agent's mistakes before they reach a human. Event-driven over Telegram, GitHub and systemd; runs on own hardware behind a local multi-model proxy.

Digital property profile for owners

verkaufe.immobilien · Remote — Internet

Full-stack engineering · Solution design · DevOps

Full-stack development of a digital property profile that owners create and maintain themselves: Vue.js front-end, Python back-end (Eve) with a REST API and MongoDB. Built and maintained the GitLab CI pipelines for automated build and deployment. Worked to DevOps principles, owning build and operation of the services in Docker. Test-driven development, automated end-to-end tests with Playwright.

Front- and back-end, heating cost billing

Brunata · Remote — Industry

Full-stack engineering · Solution design · DevOps

Production server-side services and APIs in Java and Spring Boot: a microservice that parses and generates heating-cost files in the Haweiko-Arge industry format. Designed and built in a microservices architecture with REST interfaces (OpenAPI, Swagger), secured with Spring Security and Keycloak, persisted in MongoDB. Built and maintained the GitLab CI pipelines for automated build and deployment. Worked to DevOps principles, owning build and operation of the services in Docker. Test-driven development (JUnit, Mockito), automated end-to-end tests with Playwright. Front-end development.

Web-based configuration of telecommunications devices

Deutsche Telekom · Darmstadt/Remote — Telecommunications

DevOps · Build & configuration management · Full-stack engineering

Took over an existing prototype for configuring telecommunications devices over a web interface, developed it further and moved it into production. Production server-side services and APIs in Java and Spring Boot in a microservices architecture (REST, Feign, Spring Data/JPA), Vue.js front-end, secured with Keycloak, persisted in MySQL and MongoDB. Worked to DevOps principles, owning build, operation and monitoring of the services: Docker and Kubernetes (Rancher), logging and tracing via Kibana, Sleuth and Zipkin; built and maintained the GitLab CI pipelines.
